1.0 Introduction

This document, prepared by MACTEC Engineering and Consulting, Inc. (f/k/a Harding ESE, Inc.) for McDonnell Douglas Corporation (MDC), a wholly-owned subsidiary of The Boeing Company (Boeing), presents the results of additional soil and groundwater sampling activities conducted at the Solid Waste Management Unit No. 17 (SWMU No. 17). This unit is also known as the former Transfer Area for Recovered PCE. The SWMU No. 17 site (Site) is located in Hazelwood, Missouri. Figure 1-1 displays the location of the Site.

The Supplemental Environmental Field Investigation activities described in this report were conducted in accordance with Section 7.3 (1) of the 2001 Annual Monitoring Report for SWMU No. 17 (Harding ESE, 2002a) and the Environmental Field Investigation Statement of Work (SOW) for Boeing Tract I South (Harding ESE, 2002b).

The Facility is subject to the requirements of as outlined in the final Resource Conservation and Recovery Act (RCRA) Part B Permit No. MOD000818963. This permit was issued by the Missouri Department of Natural Resources (MDNR) on March 5, 1997 pursuant to Section 3004(u) of RCRA. This Report has been prepared in accordance with Corrective Action Permit Conditions I, VI, and XIV and the MDNR-approved RFI Work Plan dated November 24, 1997.

1.1 Purpose

The purpose of the Environmental Field Investigation was to further evaluate the horizontal extent of groundwater impacts along the south and southeast side of the unit. Based on implementation of the SOW this report presents the findings of the Supplemental Environmental Field Investigation and presents MDC's evaluation and conclusions regarding the Supplemental Environmental Field Investigation data.

1.2 Environmental Field Investigation Report Organization

The Environmental Field Investigation Report is divided into six sections of text plus three appendices. A brief description of each section is presented below.

- Section 1.0, Introduction, provides background information regarding the regulatory requirements for the Site, purpose of this report, and contents of this report.
- Section 2.0, Objectives and Supporting Data Requirements, summarizes the investigation objectives, identifies the target constituents and associated investigation threshold levels (ITLs) for the Supplemental Environmental Field Investigation, and describes the established data quality objectives for the investigation.
- Section 3.0, Supplemental Environmental Field Investigation Activities, summarizes the field activities and describes the procedures that were utilized for all field sampling and laboratory analysis tasks.
- Section 4.0, Supplemental Environmental Field Investigation Results, summarizes the geological, hydrogeological, and analytical results of the Supplemental Environmental Field Investigation.

- Section 5.0, Conclusions, presents conclusions reached based on the Supplemental Environmental Field Investigation data and previous data collected from SWMU No. 17.
- Section 6.0, References, provides a list of references used within the text of this Supplemental Environmental Field Investigation report.

Three appendices are also provided to describe associated Environmental Field Investigation activities.

Appendices to this document are identified below.

- Appendix A Soil Boring Logs
- Appendix B Groundwater Sampling Field Record Forms
- Appendix C Analytical Laboratory Reports and Chain-of-Custody Forms

2.0 Objectives and Supporting Data Requirements

An investigation to delineate the nature and extent of any releases at the Site requires various types and amounts of information. Specific investigation approaches, methodologies, and data are required to facilitate the investigation process. This section of the document summarizes the general strategy presented in the 2001 Annual Monitoring Report (Harding ESE, 2002a) and the Environmental Field Investigation Statement of Work for Boeing Tract I South (Harding ESE, 2002b) for collection of the data needed to achieve the investigation objectives at the Site.

2.1 Project Objectives

The objective of the Environmental Field Investigation was to characterize the southern and southeastern extent of volatile organic compounds (VOCs) in the soil or groundwater at the Site.

2.2 Data Quality Objectives

The intended use of the various data types was evaluated to establish appropriate data quality objectives (DQOs). A summary of this evaluation is provided below.

The following DQO levels were deemed appropriate:

1. DQO Level I was deemed appropriate to conduct screening and acquire data for basic site characterization (e.g., pH, temperature, specific conductance, water level elevations, physical descriptions, photoionization (PID) readings, and other similar geologic/hydrogeologic information). Specifically, the data acquired under DQO Level I were used to
 - detect changes in groundwater characteristics.
 - develop groundwater elevation isopleth maps and evaluate groundwater flow gradients,
 - describe basic physical properties of investigated media, and
 - verify adequate purging of monitoring wells.
2. DQO Level III was deemed appropriate for soil and groundwater sample analyses. The data acquired under DQO Level III was used to characterize constituent concentrations in various media and delineate the nature/extent of any releases of hazardous wastes/constituents. These data may also be used to determine soil/groundwater clean-up objectives, support a risk assessment, and support engineering evaluations necessary to select and design corrective measures, if required.

2.3 Investigation Threshold Levels (ITLs)

ITLs were developed in the SOW to aid in the determination of whether additional field investigations, site-specific risk assessments, and/or remediation efforts are warranted. ITLs were utilized during this Environmental Field Investigation as a comparative baseline for site-specific analytical results (e.g., to determine whether a release to soil has been delineated or assess whether groundwater impacts are present). For the purposes of this Supplemental Environmental Field Investigation, ITLs represent values which incorporate both risk-based action levels and regulatory levels. As a result, the comparative process for analytical results is simplified. Similar ITLs were developed and used in connection with

investigation of the Fabrication Operations property immediately north of the Site. The ITLs to be used for this Supplemental Environmental Field Investigation incorporate changes in MDNR and U.S. Environmental Protection Agency (USEPA) risk-based action levels.

3.0 Supplemental Environmental Field Investigation Activities

This section summarizes Supplemental Environmental Field Investigation activities conducted in November and December 2002 to evaluate potential environmental impacts at the Site. These activities included: soil boring installations, soil sampling and analyses, temporary piezometer completion, and groundwater monitoring, sampling, and analyses.

3.1 Installation of Soil Borings

Three soil borings were installed to further evaluate the horizontal extent of groundwater impacts along the south and southeast side of the unit. The soil boring activities were also completed to further evaluate the geological and hydrogeological systems at the Site. The locations of the soil borings along with existing monitoring well and piezometers at the Site are presented on Figure 3-1.

Under the supervision of MACTEC field personnel, subsurface investigative activities at SWMU No. 17 were conducted by Roberts Environmental Drilling, Inc. of Millstadt, Illinois on November 11, 2002. Soil boring activities were completed using a track-mounted (GeoProbe® Model 6610DT) hydraulic probe rig.

The shallow soil borings were installed using standard direct push soil probe methodology. Direct push soil borings completed with the Geoprobe® rig were advanced using a 2.0-inch outside diameter (OD) macro-core sampler and 1.25-inch OD steel probing rods.

Prior to drilling at the initial and all subsequent borings, ancillary rig equipment was cleaned to eliminate cross-contamination between successive drilling locations. The soil sampling rods and samplers were cleaned/detergent washed between sampling locations.

Continuous soil samples were collected from each boring for field screening, lithographic description, and subsequent chemical analysis. Each disposable sampling tube liner was opened and immediately scanned with a PID to identify potential presence of VOCs. To maintain lithographic descriptive consistency, each soil sample was described and classified in accordance with the Unified Soil Classification System (USCS).

Soil cuttings generated were containerized in 55-gallon Department of Transportation (DOT)-approved drums for subsequent management by Boeing.

3.2 Soil Sampling and Analysis

Soil samples were collected from each boring to evaluate the nature and extent of any hazardous constituent or hazardous waste releases to soils at the Site. Soil sampling activities were also completed to further evaluate the geological and hydrogeological systems beneath the Site. Continuous soil samples were collected from selected borings for field screening, lithographic description, and subsequent chemical analysis.

Each soil sample was screened in the field with a PID for total organic vapors by the headspace method. This process involved placing a portion of the soil sample into a resealable plastic bag and allowing time for volatilization, if any, to occur. The PID probe was then inserted into the plastic bag. The highest PID reading measured for the initial 10-second period was recorded on the boring log form in units of parts per million (ppm).

All field screening equipment was calibrated a minimum of once per day during field efforts. Instrument calibration was performed in accordance with the manufacturers' recommended procedures using commercially available calibration standards.

Selected soil samples collected during the Supplemental Environmental Field Investigation field activities were submitted for laboratory analysis. Samples were collected per the specifications in the approved SOW.

Samples were collected into sample containers which were pre-cleaned and assembled to USEPA's Protocol "B". The volume of sample collected and the type of container used was determined by the suggested volumes described in SW-846 for the particular analysis.

Immediately upon collection, each sample was properly labeled to prevent misidentification. After labeling, the samples were placed into an appropriate storage container. Samples collected for organic analysis were placed into a storage container with sufficient ice or ice packs to preserve samples during transport to the laboratory. The samples were appropriately packaged in the storage container to minimize the potential for damage during transport. A completed chain-of-custody form was placed in each storage container to accompany the samples to the laboratory.

The sample containers were hand delivered to the mobile laboratory (Mid-America Environmental) on-site for analysis. Strict chain-of-custody procedures were maintained during sample handling. A chain-of-custody program was followed to track the possession and handling of individual samples from time of collection through completion of laboratory analysis. Copies of the chain-of-custody record were retained in the permanent file for proper documentation.

Soil samples were analyzed for VOCs and high fraction total petroleum hydrocarbon (TPH). Analytical results for the soil samples are provided in Section 4.0.

3.3 Installation of Temporary Piezometers

Temporary piezometers installed within the shallow groundwater unit were constructed of 1-inch diameter; polyvinyl chloride (PVC) with flush-threaded joints was placed within the open borehole of each shallow boring (3 in total). Six-foot screen sections were utilized at the bottom of each piezometer. The piezometer material was new, decontaminated well material contained in individually sealed plastic bags.

Upon completion of groundwater sampling, the temporary piezometers were pulled and disposed. The two soil borings inside Building 48 were filled with granular bentonite and the surface concrete was repaired, the boring located north of Building 48, Boring B48N1 was converted to a piezometer (TP-26). This piezometer consisted of two 5-foot sections of prepacked well screen and a 5-foot riser and was installed through the Geoprobe 2-inch diameter rods. The prepack well screen consisted of a $\frac{1}{2}$ inch inner diameter slotted pipe encased in a 1 inch diameter slotted pipe with the inner annulus filled with rounded silica sand. The bottom of the well was placed at 14 feet below ground surface (bgs) and sand was added through the Geoprobe rods. As the rods were removed the well pulled up about two feet, resulting in a total depth of 12 feet bgs. Sand was placed around the outside of the screen to a point six inches above the screen and a eight inch thick layer of bentonite was placed on top of the sand pack. The piezometer was complete at the surface with a flush mounted well box cemented in the concrete drive.

3.4 Groundwater Monitoring

Groundwater monitoring activities were performed within a few hours of the installation of the three soil borings and temporary piezometers. The piezometer subsequently installed at the location of Boring B48N1 (TP-26) was also sampled during the fourth quarter groundwater sampling in December 2002.

Prior to the collection of groundwater samples, each temporary piezometer was purged by removing a minimum of one well casing volume of groundwater with a disposable polyethylene bailer. Piezometer TP-26 was purged by bailing three well volumes. Samples were collected using dedicated, disposable polyethylene bottom-loading bailers using appropriate collection procedures as specified in the SOW.

The sample containers were hand delivered to the mobile laboratory (Mid-America Environmental) on-site for analysis or shipped via overnight courier to Environmental Science Corporation in Mt. Juliet, Tennessee. Samples were shipped to the off-site laboratory so that they were received within 24 hours from the time of shipment. Strict chain-of-custody procedures were maintained during sample handling.

A chain-of-custody program was followed to track the possession and handling of individual samples from time of collection through completion of laboratory analysis. Copies of the chain-of-custody record were retained in the permanent file for proper documentation. Analytical results for the groundwater samples are provided in Section 4.0.

3.5 Soil Boring and Sample Designations

All soil borings installed during the Supplemental Environmental Field Investigation were designated by location and direction from the nearest building. For example, the first soil boring installed north of Building 48 was designated B48N1. The first soil boring installed inside Building 48 was designated B48I1. Soil samples collected from each boring were identified by probe location and sample depth. For example, the soil sample collected from probe B48N1 at a depth of 9 feet bgs was designated as B48N1-9. Groundwater samples collected from temporary piezometers were designated with a "W" at the end of the boring number, i.e. a groundwater sample collected from B48I1 was designated B48I1W.

The piezometer installed at the location of Boring B48N1 was identified as TP-26 in keeping with the numbering system established for SWMU No. 17.

4.0 Supplemental Environmental Field Investigation Results

This section discusses the geological, hydrogeological, and chemical analysis results of the Supplemental Environmental Field Investigation and characterizes the nature and extent of hazardous waste/constituent releases at the Site.

Results of the soil boring installation indicated that the subsurface lithology is consistent with that previously described for the site (Harding ESE , 2002a). Copies of the soil boring logs are provided in Appendix A. Copies of the groundwater sampling field record forms are provided in Appendix B and copies of the laboratory analytical reports and chain-of-custody documents are provided in Appendix C.

4.1 Results for SWMU No. 17 Area

Analytical soil data, analytical groundwater data, geological soil boring data, and various field data/measurements were utilized to characterize the nature and extent of any hazardous constituent/waste impacts from the SWMU No. 17.

4.1.1 Analytical Results for Soil Samples from SWMU No. 17 Area

Analytical results for soil samples from the three borings installed in the SWMU No. 17 Area were utilized to assess the southern extent of any impacted soils at this location.

A soil samples was collected from each of the borings (B48N1, B48I1, and B48I2) and submitted for chemical analysis to evaluate any potential impacts to soil at this location. Soil boring locations are displayed in Figure 3-1. Table 4-1 presents a summary of analytical results for constituents detected in the soil samples from the SWMU No. 17 Area.

Soil samples were analyzed for VOCs by Method 8021 and for TPH by Method OA-2. No constituents were detected.

4.1.2 Analytical Results for Groundwater Samples from SWMU No. 17 Area

Analytical results for groundwater samples from the SWMU No. 17 Area were utilized to characterize the southern extent of impacted groundwater from the SWMU No. 17 Area.

Groundwater samples were collected from the three temporary piezometers installed in the area and submitted for chemical analysis to evaluate any potential impacts to groundwater at this location. Soil boring/temporary piezometer locations are displayed in Figure 3-1. Table 4-2 presents a summary of analytical results for constituents detected in the groundwater samples from the SWMU No. 17 Area.

Groundwater samples were analyzed for VOCs by Method 8021 and for TPH by Method OA-2 or TPH Diesel Range Organics (DRO). No constituents were detected during the initial sampling. Two VOCs were detected in piezometer TP-26 during the fourth quarter sampling (December 2002). These compounds, cis-1,2-dichloroethene and tetrachloroethene were detected at levels of 14 ug/L and 3.4 ug/L

which are below the respective ITLs of 70 ug/L and 5 ug/L. The tetrachloroethene detection was J qualified by the laboratory as an estimated value that was below the practical quantitation limits but above the method detection limit.

5.0 Conclusions

The results of the Supplemental Environmental Field Investigation combined with the previous investigative work at SWMU No. 17 and the additional investigative work conducted during the Tract 1 South investigation (Environmental Field Investigation Report for Boeing Tract 1 South, MACTEC, 2003), indicate that the soil and groundwater at SWMU No. 17 have been characterized and the lateral extent of VOC and TPH impact has been established.

VOCs were detected during concurrent Tract 1 South field investigation in the vicinity of Building 41 in both the shallow and deep groundwater. The VOC detections in the vicinity of Building 41 appear to be the result of storage activities in the immediate vicinity of Building 41. Historical aerial photos show numerous drums stored around Building 41. Laboratory analysis from temporary piezometers and monitoring wells located down gradient of SWMU No. 17 and upgradient of Building 41 support the position that migration is not occurring. These sampling points include MW-11S, MW-11I, MW-10S, TP-26, B44N1, B41N1, B41S1, and MW-18. Building 41 is located approximately 1,050 feet east of SWMU No. 17. Also, laboratory analysis from temporary piezometers and monitoring wells on the southern portion of the GKN property (former Boeing Fabrication Operation Facility, Tract 1 North) and north of Building 41 show that migration is not occurring from the former Fabrication Operation Facility site (ESE, 2000). These sampling points include B22E2, B22E3, B27S1, B27S2, B27S3, B41N1, B2N1, and B2N2.

As part of the concurrent Tract 1 South field investigation, a deep piezometer (B48S4D) was installed to the top of bedrock at a depth of 76 feet below ground surface at the southeast corner of Building 48. However, groundwater was not encountered and a sample could not be obtained to assess the potential presence of VOCs in the deep groundwater at that location.

As stated in the 2001 Annual Monitoring Report for SWMU No. 17 (Harding ESE, 2002a), it is suspected that TPH impacts observed at SWMU No. 17 are not solely attributable to MDC sources. Two pipelines run along the north side of Banshee Road for the transport of petroleum products to the airport. Representatives of the St. Louis Pipeline Corporation, the owner of one of the pipelines, were interviewed by Boeing in August 2002. They were not aware of any leakage from their pipeline. St. Louis Pipeline purchased the pipeline in 1994 and replaced the 4-inch line with an 8-inch line. The new line was pressure tested prior to being placed into service. The ownership of the second pipeline is not known. Representatives of St. Louis Pipeline, Phillips, Conoco, and Shell were contacted by Boeing but were unable to provide information regarding this pipeline or ownership of the pipeline.

Underground storage tanks (USTs) that existed on non-MDC property to the west and upgradient of SWMU No. 17 may also have contributed to the TPH impact at SWMU No. 17. Analytical data provided by Lambert-St. Louis International Airport from samples collected by the airport from this area indicate elevated levels of TPH in the soil.

A RCRA Facility Investigation (RFI) report for the entire permitted site, including SWMU No. 17, will be prepared following MDNR's concurrence that the site has been properly

characterized. A risk assessment will be conducted site wide (Tract 1 North and Tract 1 South). Information obtained from the risk assessment will be used to develop clean up levels and help determine appropriate remediation methods.

Analytical Laboratory Reports and Chain-of-Custody Forms

**MID-AMERICA
ENVIRONMENTAL**

December 5, 2002

Mr. Dennis Brinkley
MACTEC
3199 Riverport Tech Center Drive
St. Louis, MO 63043

SUBJECT: DATA REPORT – MACTEC Project #510200

**Boeing
Tract 1 South
St. Louis MO**

Mid-America Environmental Project # 021107W1

Mr. Brinkley;
Enclosed, please find the data report for the above referenced location. The soil and water samples were analyzed in Mid-America Environmental's laboratory using appropriate methods and equipment.

Project Summary

The following analyses were conducted:

- 22 soils for EPA Method 8021
- 24 waters for EPA Method 8021
- 16 soils for Iowa Method OA-1
- 32 soils for Iowa Method OA-2
- 19 waters for Iowa Method OA-1
- 36 waters for Iowa Method OA-2

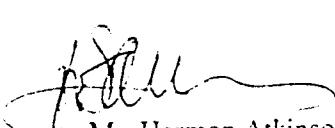

The samples were received in appropriate containers with appropriate labels, seals, and chain-of-custody documentation.

Project Narrative

The results for all analyses and required QA/QC analyses are summarized in the enclosed tables. All calibrations, blanks, and spike recoveries fulfill quality control criteria.

Mid-America Environmental appreciates the opportunity to provide analytical services to MACTEC on this project. If you have any questions relating to this data or report, please do not hesitate to contact us.

Sincerely,

Mr. Hermon Atkinson
President

REPORT OF ANALYSIS

Mr. Dennis Brinkley
Harding ESE - St. Louis, MO
3199 Riverport Tech Center Drive
St. Louis, MO 63043

December 19, 2002

Date Received : December 12, 2002
Description : Boeing-SWMU 17
Sample ID : MW5DSW
Collected By : Jack E. Friesner
Collection Date : 12/11/02 09:10

ESC Sample # : L98577-10

Site ID : BOEING GW MONITORING
Project # : 517042

Parameter	Result	Det. Limit	Units	Method	Date	Dil.
Surrogate Recovery						
Toluene-d8	99.		% Rec.	8260B	12/15/02	1
Dibromofluoromethane	110		% Rec.	8260B	12/15/02	1
4-Bromofluorobenzene	89.		% Rec.	8260B	12/15/02	1
TPH (GC/FID) High Fraction	BDL	0.10	mg/l	3510/DRO	12/17/02	1
Surrogate Recovery (50-150) o-Terphenyl	65.		% Rec.	3510/DRO	12/17/02	1

BDL - Below Detection Limit

Det. Limit - Estimated Quantitation Limit (EQL)

Laboratory Certification Numbers:

	1,1-Dichloropropene	J4

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
B	(EPA) - The indicated compound was found in the associated method blank as well as the laboratory sample.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is unacceptably high
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is unacceptably low
T8	(ESC) - Additional method/sample information: Sample(s) received past/too close to holding time expiration.
O	(ESC) Sample diluted due to matrix interferences that impaired the ability to make an accurate analytical determination. The detection limit is elevated in order to reflect the necessary dilution.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable unless qualified as 'R' (Rejected).

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

Control Limits

2-Fluorophenol	31-119	Nitrobenzene-d5	43-118	Dibromfluoromethane	72-125
Phenol-d5	12-134	2-Fluorobiphenyl	45-128	Toluene-d8	79-120
2,4,6-Tribromophenol	51-141	Terphenyl-d14	43-137	4-Bromofluorobenzene	66-131

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.
